

PIERRE AUGER OBSERVATORY

The Pierre Auger Observatory

On the vast plain known as the *Pampa Amarilla* in western Argentina, the Pierre Auger Observatory is studying the highest-energy particles in the Universe, which hit the Earth from all directions, so-called cosmic rays. Cosmic rays with low to moderate energies are well understood, while those with extremely high energies remain highly mysterious. By detecting and studying these rare particles, the Pierre Auger Observatory is tackling the enigmas of their origin and existence.

Area: 3,000 km²
(30 times the size of Paris)

Surface Detector
1,660 surface detector stations
(1,500 m apart from each other)

Fluorescence Detector
27 fluorescence telescopes
(in 4 different places)

The Pierre Auger Collaboration

- ~ 500 scientists
- ~ 90 institutes
- 16 countries
- construction budget: US\$ 54 million
- 60 published peer-reviewed papers
- > 7,000 citations

Location:

Malargüe, Province of Mendoza, Argentina

Main Goals:

Determination of the energy, direction and mass composition of cosmic rays with energies above 10¹⁸ eV to better understand the universe.

Auger Spokespersons / Contact Persons

Karl-Heinz Kampert (kampert@uni-wuppertal.de)
Spokesperson of the Pierre Auger Observatory.
Professor of physics and chair of astroparticle physics at the Bergische Universität Wuppertal, Germany.

Antonio Bueno (a.bueno@ugr.es)
Co-spokesperson of the Pierre Auger Observatory.
Professor of physics at the Universidad de Granada, Spain.

Founding Fathers of Auger

Jim W. Cronin
Spokesperson Emeritus of the Pierre Auger Observatory.
Professor Emeritus at the University of Chicago, USA.
Nobel Prize in Physics in 1980 together with Val L. Fitch, for their discovery of the asymmetry in the behaviour of matter and antimatter.

Alan A. Watson
Spokesperson Emeritus of the Pierre Auger Observatory.
Professor Emeritus at University of Leeds, United Kingdom.
Fellow of the Royal Society since 2000.

More information at
www.auger.org

PIERRE AUGER OBSERVATORY

Timeline

- 1992** Jim W. Cronin and Alan A. Watson suggest building a giant air shower array with much greater collecting power than had ever been considered previously.
- 1995**
Jan 30 – Jul 31 Production of a design report – reference design and cost estimate – by the Design Group for the Auger Project hosted by Fermilab, Illinois, USA. This becomes the basis for funding proposals in 17 participating countries.
- 1995**
Nov A meeting is held in Paris to form the collaboration. It chooses site the site of Mendoza, Argentina in the Southern Hemisphere. The Observatory is named after the French physicist Pierre Victor Auger.
- 1999**
Mar Signature of the International Agreement in Mendoza.
- 2000** Beginning of the construction of the observatory.
- 2001** The Engineering Array – a full-scale prototype of the first 32 SD stations and a single fluorescence telescope – is operated for 6 months. It is later integrated into the main setup and used for more detailed design choices and calibration.
- 2003** The Observatory becomes the largest detector in the world for the detection of ultra-high energy cosmic rays.
- 2004** First physics results are reported from more than 100 surface detector stations.
- 2007**
May Release of 1% of the data to the public for outreach purposes. The data can be explored at the website of the Public Event Display (www.auger.org/event-display).

AugerPrime

The upgrade will consist of enhanced surface detector stations (SSD), faster electronics, dedicated underground muon detectors and optimized operations for the fluorescence telescopes.

Ten more years of operation is planned to double the data set and to particularly study:

- The origin of the flux suppression at ultra-high energy,
- The proton contribution at highest energies ($E > 6 \cdot 10^{19}$ eV), leading to a so-called “particle astronomy”
- New particle physics beyond the reach of the LHC

Key questions addressed by the Observatory

What is it made of?
How does it get to us?
Where does it come from?
How does the airshower of billions of particles develop?
How does it get 100.000.000 times the energy of a proton in the LHC?

How can we improve the detector?

Preliminary results indicate that the directions of origin of the 27 highest-energy events are correlated with the locations of active galactic nuclei (AGNs).

2007
Nov

Observation of the energy spectrum of cosmic rays confirms that the flux is strongly suppressed above $4 \cdot 10^{19}$ eV as predicted by the GZK theory.

2008

Best present limits are set on the detection of photons with an energy of 10^{18} eV.

2009

Observations of the depth of the maximum of air-shower profiles above 10^{18} eV give first hints on the composition of cosmic rays at ultra-high energy.

2010

Solar physics with the Auger Observatory.

2011

Measurement of the proton-proton cross section at a centre-of-mass energy of 57 TeV, complementing results from the LHC – always below 14 TeV.

2012

Best present limits on the detection of neutrinos with an energy of 10^{18} eV.

2013

Observation of large-scale anisotropies: Arrival directions of cosmic rays are not evenly distributed, giving hints on the origin – whether galactic or extragalactic – of cosmic rays at ultra-high energy.

2015

Observations of a deficit in the number of muons in air showers challenge predictions from hadronic interaction models.

2015

AugerPrime – Celebrate 15 years of achievements and signature ceremony of a new International Agreement for the next ten years (www.auger.org/augerprime).

2015

PIERRE AUGER OBSERVATORY

Enhancements and further developments to the Observatory

HEAT – High Elevation Auger Telescopes

- 3 FD telescopes with elevated field of view – being tilted by 29°
- designed to cover the elevation range from 30° to 58° , which lies above the field of view of the standard FD telescopes
- extends the energy range of cosmic air-shower measurements down to 10^{17} eV

AMIGA – Auger Muons and Infill for the Ground Array

- an infilled area of 61 surface detector stations, deployed on a 750 m triangular grid of 23.5 km^2 , each paired in the future with a 30 m^2 plastic scintillator and buried 2.3 m underground
- first 7 stations with muon detectors have been deployed in an engineering array called the Unitary Cell (UC), completed in Feb. 2015
- measures the muon content of air showers

AERA – Auger Engineering Radio Array

- 153 radio detection stations spread on an area of 17 km^2
- radio-station array completed in April 2015
- detects the radio emission from cosmic-ray showers in the frequency range of 30-80 MHz
- measures the cosmic-ray composition beyond $3 \cdot 10^{18} \text{ eV}$
